Django Authentication

Topics

- Django's Authentication System
 - User Objects
 - Authentication
 - Login and Logout
- Permissions and Authorization

Authentication System

- Django's authentication system consists of:
 - **User** objects
 - A configurable password hashing system
 - Forms and view tools for logging in users, or restricting content.
 - **Permissions**: Binary (yes/no) flags designating whether a user may perform a certain task.
 - **Groups**: A generic way of applying labels and permissions to more than one user.

Installation

- Add these 2 items in **INSTALLED_APPS** setting:
 - **'django.contrib.auth'** : contains the core of the authentication framework, and its default models.
 - **'django.contrib.contenttypes'**: allows permissions to be associated with models you create.
- Add these 2 items in **MIDDLEWARE_CLASSES** setting:
 - **SessionMiddleware**: manages sessions across requests.
 - **AuthenticationMiddleware**: associates users with requests using sessions.
- By default: already included in **settings.py**.

User Objects

- **User objects** are the core of the authentication system.
 - Typically represent people interacting with your site.
 - Used to enable things like restricting access, registering user profiles etc.
 - Only one class of user exists in Django's authentication framework
 - Different user types e.g., '**superusers**' or admin '**staff**' users are just user objects with special attributes set
 - not different classes of user objects.

User Attributes

- The primary attributes of the default user are:
 - **Username:** Required. 30 characters or fewer.
 - May contain alphanumeric, _, @, +, . and - characters.
 - *first_name*: Optional. 30 characters or fewer.
 - *last_name*: Optional. 30 characters or fewer.
 - *Email*: Optional. Email address.
 - **Password:** Required.
 - A hash of, and metadata about, the password.
 - Django doesn't store the raw password.
 - <algorithm>\$<iterations>\$<salt>\$<hash>
 - Algorithm = PBKDF2, Hash = SHA256
 - Iteration = 640000

Using Admin Interface

- Admin module can be used to view and manage users, groups, and permissions.
 - Both `django.contrib.admin` and `django.contrib.auth` must be installed.
 - The “Add user” admin page requires you to choose a `username` and `password` before allowing you to edit the rest of the user’s fields.
 - User passwords are not displayed in the admin (nor stored in the database).
 - a link to a `password change form` allows admins to change user passwords

The screenshot shows the Django administration interface for adding a new user. The page title is 'Django administration' and the breadcrumb trail is 'Home > Authentication and Authorization > Users > Add user'. On the left, there is a sidebar with a search bar and a list of links under 'AUTHENTICATION AND AUTHORIZATION' (Groups, Users) and 'MYAPP2' (Book1s, Kinds). The main content area is titled 'Add user' and contains instructions: 'First, enter a username and password. Then, you'll be able to edit more user options.' There are three input fields: 'Username' (with a required field error message: 'Required. 150 characters or fewer. Letters, digits and @/./+/-/_ only.'), 'Password' (with multiple error messages: 'Your password can't be too similar to your other personal information.', 'Your password must contain at least 8 characters.', 'Your password can't be a commonly used password.', and 'Your password can't be entirely numeric.'), and 'Password confirmation' (with a required field error message: 'Enter the same password as before, for verification.').

Using Admin Interface

Django administration

Change user

meer

Username:

meer

Required: 150 characters or fewer. Letters, digits and @/./+/-/_ only.

Password:

algorithm: pbkdf2_sha256 iterations: 320000 salt: 8rSbm1***** hash: bIYSuH*****

Raw passwords are not stored, so there is no way to see this user's password, but you can change the password using [this form](#).

Personal info

First name:

Last name:

Email address:

dr.usama.mir@gmail.com

HISTORY

Changing Passwords

- Django does not store raw (clear text) passwords on the user model,
 - It only stores a hash.
 - Do **not** manipulate the password attribute of the user directly.
 - **`user.password = 'new password'` # Don't do this!**
 - Passwords can be changed using **`set_password()`**

```
from django.contrib.auth.models import User
u = User.objects.get(username='john')
u.set_password('new password')
u.save()
```

Authenticating Users

- *authenticate()*: Takes credentials in the form of **keyword arguments**:
 - For the default configuration this is **username** and **password**
 - Returns a **User object** if the password is valid for the given username.
 - Returns **None** if the credentials are invalid.
 - **authenticate**(request=*None*, **credentials)

Authenticating Users

```
from django.contrib.auth import authenticate
user = authenticate(username='john', password='secret')
if user is not None: # password verified for the user
    if user.is_active:
        print("User is valid, active and authenticated")
    else:
        print("The credentials are valid, but the account has been disabled!")
else: # unable to verify the username and password
    print("username and password did not match.")
```

Login

- ***login()*** function: used to attach an authenticated user to the current session.
 - It takes an **HttpRequest** object and a **User** object.
 - Associates the **user** with the current **request** object
 - Ex. login(request,user)
 - Any data set during the **anonymous session** is retained in the session after a user logs in.
 - ***login()*** function can be called from a **view**.
- Normally, **authenticate()** is used before **login()**.

Logout

- Use `django.contrib.auth.logout()` within your view.
 - It takes an `HttpRequest` object and has no return value.
 - `logout()` does not throw any errors if the user wasn't logged in.
 - Cleans out the session data for the current request

```
from django.contrib.auth import logout
```

```
def logout_view(request):  
    logout(request)  
    # Redirect to a success page.
```

Default Permissions

- 4 default permissions created for each Django model defined in one of your installed apps :
 - *Add*: Access to view the “add” form and add an object
 - limited to users with “add” permission for that type of object.
 - *Change*: Access to view the change list, view the “change” form and change objects
 - limited to users with the “change” permission for that type of object.
 - *Delete*: Access to delete objects
 - limited to users with the “delete” permission for that type of object.
 - *View*: Access to view objects

Assign User Permissions

Start typing to filter...	
AUTHENTICATION AND AUTHORIZATION	
Groups	+ Add
Users	+ Add
MYAPP1	
Items	+ Add
Order items	+ Add
Types	+ Add
Users	+ Add

☐ Superuser status

Designates that this user has all permissions without explicitly assigning them.

Groups:

Available groups ?

Choose all ?

Chosen groups ?

Remove all

The groups this user belongs to. A user will get all permissions granted to each of their groups. Hold down "Control", or "Command" on a Mac, to select more than one.

User permissions:

Available user permissions ?

admin | log entry | Can add log entry
admin | log entry | Can change log entry
admin | log entry | Can delete log entry
admin | log entry | Can view log entry
auth | group | Can add group
auth | group | Can delete group
auth | group | Can view group

Chosen user permissions ?

auth | group | Can change group

Groups

- Groups allow you to apply permissions to a group of users.
 - A user in a group automatically has the permissions granted to that group.
 - Also a convenient way to categorize users to give them some label, or extended functionality.

Create Users and Assign Them to Groups

dummy

Username:

dummy

Required. 150 characters or fewer. Letters, digits and @/./+/-/_ only.

Password:

algorithm: pbkdf2_sha256 **iterations:** 320000 **salt:** jLe72y***** **hash:** d7Au9f*****

Raw passwords are not stored, so there is no way to see this user's password, but you can change the password using [this form](#).

Permissions

☒ Active

Designates whether this user should be treated as active. Unselect this instead of deleting accounts.

☐ Staff status

Designates whether the user can log into this admin site.

☐ Superuser status

Designates that this user has all permissions without explicitly assigning them.

Groups:
